

About the P-Shot Procedure

The P Shot® is an in-office procedure that uses your own blood to increase circulation and blood flow to the penis. First, the doctor or nurse applies a numbing lidocaine cream to the penis. Then blood is drawn from the arm in the same way as with any blood test. Next, a centrifuge and special method is used to isolate platelet rich plasma (PRP) from your own blood.

The liquid is transferred into a syringe and injected into the penis using a tiny needle and in a way that distributes the growth factors released by the platelets in the proper way.

Recovery Time

There is no recovery time for this in-office procedure, nor are there any special care instructions.

The Priapus Shot® procedure does not work well in smokers for the same reason that a plastic surgeon would never do a facelift or breast implants on a smoker—the poisons in the cigarettes will kill the growth of the stem cells that are recruited and fertilized by the PRP.

The initial volume is from the combination of the platelets and the serum (or water) in the blood plus all the growth factors in the water that the activated platelets are starting to release.

Then over the next three days, some of the water is absorbed by the body. Then there is the growth of new tissue that continues for at least 12 weeks—bringing the volume back up to close to where it was with the initial injection.

So, volume goes up IMMEDIATELY, then goes down to various degrees but slowly over the next three days. In some people this decrease in volume is very small, in others, it is a more noticeable decrease. In some, growth is back to where it was with the initial injection or better. In others, there is growth but not quite back to where we started. Smokers have the least amount of growth.

Results

The men usually enjoy the effects of the **P-Shot™** almost immediately as the growth factors begin to rejuvenate and enhance the sexual response.

Many men also report the following benefits from the **P-Shot™**:

- Immediately larger penis
- Strengthen the penis
- Straighten the penis
- Increase circulation within the penis for a healthier organ
- Makes other therapies work better (if you still need Viagra or Cialis, then it will work better for you)
- Increase sensation and pleasure (helps correct the damage from diabetes)
- Increase size by design (Can place more in base or in the head or wherever makes for best result)
- No allergic reactions (using your own body's fluids)
- No lumpiness
- Minimal pain

P-Shot® FAQs

How much growth can I expect?

10 to 20% increase in length and girth. An inch in length (a little more) and in girth was seen in the first two patients in the first month. Girth came first (with the injection), then length (with continued growth).

Where is the injection put?

Directly into the corpus cavernosum with a small needle, and into the head of the penis—in a way almost exactly as done with those who use injections for erectile dysfunction.

What about scar tissue?

With this procedure, there is only one injection, so the chances of scar tissue should be almost nothing. In the face, there has not been the report of any fibrosis or scar tissue formation.
